DB-EZReorg

When an IDMS database requires a Re-Org, your biggest problem is scheduling. First you must "guess-timate" how long it will take. Then you must find the time to bring Production "down" to perform the Re-Org. The window of opportunity is often not large enough, and requires working around the clock over week-ends.

In the world of DB-EZReorg you begin your IDMS database Re-Org any time you want and, most importantly, keep your Production environment operating as if no Re-Org is going on at all. You can take all the time in the world to finish the Re-Org without bringing your Production environment "down."

In the world of DB-EZReorg you'll never spend another weekend doing an IDMS database Re-organization.

AT RUN-TIME...

First, take a snap shot copy of your Production database (Production remains "up")

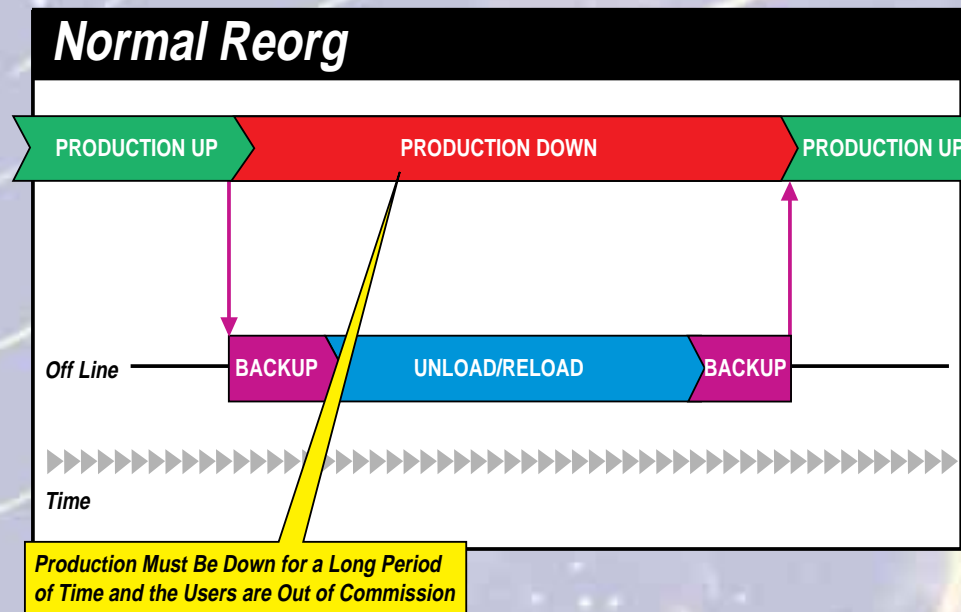

Unload/Reload the copy (Production remains "up")

Perform a DB-EZReorg "catch-up" roll forward process, applying all Production updates (since the snap shot copy was first taken) to the re-organized database (Production remains "up")

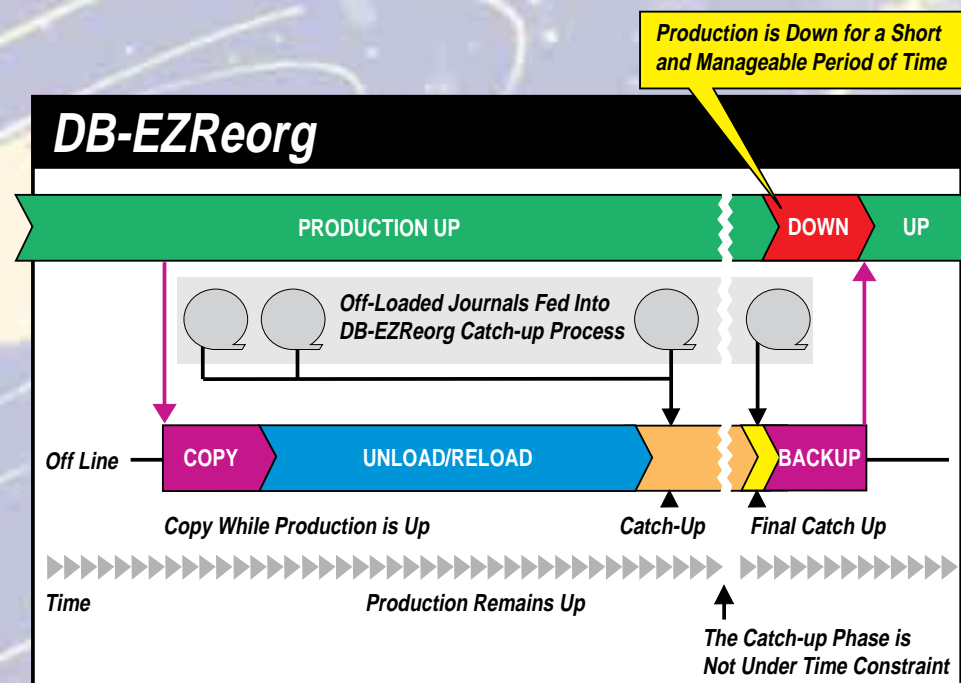

Bring Production "down" for a short period of time to perform the final phase of "catch-up"

Point to the reorganized database and bring production up
